

CTMD Q3–Q4 Dashboard Changes

A short working-group brief: the decisions we need from you to move these changes forward, and the data already in CTMD that can support them.

Epic CTMD-168 · prepared for the TIN Metrics Working Group · figures from live CTMD data

Thank you for the July 17 requests and mock-ups. Most items are clear and buildable. A handful of open questions in the document — several flagged as “open for input” — will shape how we build them. This page collects those decisions in one place and shows the relevant data so the group can decide with the full picture.

Decisions we need from you

Grouped to match your requirements document — each item sits under the chart or section it affects.

To all charts — export

What should “export the filtered visual/data” include?

The request is to export the filtered **visual and data**, so we read it as both — the underlying rows *and* the chart image (useful for slide decks like the TIN Metrics deck).

OUR PROPOSAL

Deliver **both** on every chart: a

CSV

of the currently-filtered data, plus a

PNG IMAGE

of the chart as shown. We’d ship CSV first (highest analytical value), then image export. Please confirm that ordering works — and whether you’d prefer

SVG

(crisper for print) over PNG for the image.

Proposals by Application Status Chart

deck slides 2–4

Should VUMC RIC be split into TIN Cycle 1 vs 2 — by date?

The other TIC assignments map cleanly to a single cycle. **VUMC RIC is the one that bridges both cycles:** its 160 proposals span the entire program (2016–2026), so it can’t be placed in one cycle wholesale.

VUMC RIC submissions by year: 2016 → 5, ‘17 → 11, ‘18 → 18, ‘19 → 26, ‘20 → 24, ‘21 → 12, ‘22 → 16, ‘23 → 10, ‘24 → 18, ‘25 → 12, ‘26 → 7.

WHAT WE NEED

Splitting by a submission-date cutoff is straightforward — [please give us the date that separates TIN 1.0 from 2.0](#) (e.g. everything before `YYYY-MM-DD` = Cycle 1). Or: keep VUMC RIC as its own group, or exclude it from cycle comparisons.

Which other variables should sort/group this chart?

What exists today: the status chart has **no** filter or sort controls — that’s exactly what this adds. The underlying fields (Therapeutic Area, Phase of Study, Submitting Institution, Funding Source) do live in the data, and a power user can add them as *table* columns via the Profile settings page — but that path is buried and doesn’t touch the chart. (HEAL is a global on/off toggle.) So bringing these onto the chart is a genuine, useful addition. Strongest candidates:

Field (already in CTMD)	Distinct values	Coverage	Good on a chart for...
Therapeutic Area	85	76%	grouping by disease area
Phase of Study	7	74%	clean, low-count grouping
Submitting Institution	66	79%	who is submitting
Funding Mechanism	13	48%	grant type
COVID study (Yes/No)	2	flag	quick chart filter

WHAT WE NEED

Which of these existing fields to expose [on the chart](#). Therapeutic Area and Phase of Study are the strongest candidates. (HEAL is already a global filter — no change needed.)

How should statuses be grouped — “Active/Completed” and the presets?

Two requested features both need a defined mapping over the **33 distinct statuses:** the **Active vs Completed** filter, and the quick-filter **presets** (“Initial Consults”, “Comprehensive Consults”, “Pilots”, “Full Implementation Studies”, “Resources”).

WHAT WE NEED

Your intended status membership for each. [We’ll pre-fill a first draft](#) from the current groupings and the status list for you to review and edit.

Which chart types are most useful here?

Milestone-to-milestone durations vary a lot between proposals, and some later stages have relatively few data points. The chart type determines what that variability looks like.

- **Bar** — a single average/median per interval. Simplest to read, but hides spread and outliers.
- **Box & Whisker** — median, typical range (quartiles), and outliers. Best when you care *how much* timelines vary, not just the average.

WHAT WE NEED

We recommend supporting both with a toggle, defaulting to **Box & Whisker** (it makes outliers visible, the stated goal). Please confirm — and tell us which intervals matter most so we prioritize them.

Submissions by Month

No open decisions here — the requested interval dropdown (week / month / quarter / year), flexible date bounds, period comparison, and axis fixes are all buildable as specified.

Proposal Tab

How should we show aggregate pathways (Sankey, etc.)?

The goal — “how many initial consults go to comprehensive, then to what outcomes, and with what timelines” — is a great question. **We checked REDCap directly** and found:

- The proposal-status field (`protocol_status`) stores only the **current** status — there is no history field in the data itself.
- **REDCap’s audit log does record every status change, with timestamps** — so the real pathway history exists. But our CTMD REDCap account currently **lacks “Logging” export access**, so we can’t pull it yet (the API returns “you do not have Logging privileges”).

WHAT WE NEED — AND A SMALL ACCESS ASK

To build a **genuine** pathway Sankey from the real transitions, we’d ask the VUMC REDCap admins to grant the CTMD API account

LOGGING EXPORT ACCESS

. Otherwise we can **approximate** pathways from the milestones a proposal has reached — directional, no access change needed. Which direction would you like?

What is the “intake date”?

“Filter by intake date” could mean the proposal **submission** date, or the first consultation contact — they differ.

WHAT WE NEED

Which date you mean by “intake”.

Reference — how the cycle grouping maps to the data

For reference — the TIN Cycle grouping isn’t a stored field; it’s derived from the TIC each proposal is assigned to. The assignments map to the cycles as follows (proposal counts shown):

TIN Cycle	TIC assignment	Proposals
Cycle 1 (TIN 1.0)	University of Utah TIC	87
	Duke/VUMC TIC	82
	JHU/Tufts TIC	77
Cycle 2 (TIN 2.0)	JHU TIC	76
	VUMC TIC	56
Bridges both → see Q1	VUMC RIC	160
